TITLE: Binder treated particles

Detailed Description Text (15):

Bleaching processes, such as chlorine or ozone/oxygen bleaching may also be used in pretreating the fibers. In addition, the fibers may be pretreated, as by slurrying the fibers in baths containing various solutions. For example, antimicrobial solutions (such as solutions of antimicrobial particles as set forth below), as well as solutions of fertilizers and pesticides, and/or fragrances and flavors, for release over time during the life of the fibers. Fibers pretreated with other chemicals, such as thermoplastic and thermoset resins also may be used. Combinations of pretreatments also may be employed with the resulting pretreated fibers then being subjected to the application of the binder coating as explained below.

Detailed Description Text (19):

Specific examples of natural fibers that contain a hydrogen bonding functionality include chopped silk fibers, wood pulp fibers, bagasse, hemp, jute, rice, wheat, bamboo, corn, sisal, cotton, flax, kenaf, peat moss, and mixtures thereof. Suitable synthetic fibers with hydrogen bonding functionalities include acrylic, polyester, carboxylated polyolefins, rayon and nylon. The hydrogen-bonding functionality is an ester in acrylic fibers and a carboxylic acid in carboxylated polyolefin fibers, an ester in polyester, an amide in nylon, and a hydroxyl in rayon. Polyethylene and polypropylene would be unsuitable fibers for use in particle to fiber bonding in the manner of the present invention because they include only carbons and hydrogens without any other atoms, such as oxygens or nitrogens, that can participate in hydrogen bonds.

Detailed Description Text (31):

In one disclosed embodiment the added particles are superabsorbent particles, which comprise polymers that swell on exposure to water and form a hydrated gel (hydrogel) by absorbing large amounts of water. Superabsorbents are defined herein as materials that exhibit the ability to absorb large quantities of liquid, i.e., in excess of 10 to 15 parts of liquid per part thereof. These superabsorbent materials generally fall into three classes, namely starch graft copolymers, crosslinked carboxymethylcellulose derivatives and modified hydrophilic polyacrylates. Examples of such absorbent polymers are hydrolyzed starch-acrylonitrile graft copolymer, a neutralized starch-acrylic acid graft copolymer, a saponified acrylic acid ester-vinyl acetate copolymer, a hydrolyzed acrylonitrile copolymer or acrylamide copolymer, a modified cross-linked polyvinyl alcohol, a neutralized self-crosslinking polyacrylic acid, a crosslinked polyacrylate salt, carboxylated cellulose, and a neutralized crosslinked isobutylene-maleic anhydride copolymer.

DOCUMENT-IDENTIFIER: US 6372333 B1

TITLE: Composition containing inorganic porous crystals-hydrophilic macromolecule composite and product made therefrom

Brief Summary Text (14):

5. The composition of the above-mentioned (1), wherein the hydrophilic macromolecule is at least one member selected from the group consisting of natural cellulose, regenerated cellulose, bacterial cellulose, chemically-modified cellulose, silk wool, polyacrylamide, polyvinyl alcohol, crosslinked polyvinyl alcohol, chitin, chitosan, ethylene-vinyl acetate copolymer and polyvinyl formal.

Brief Summary Text (15):

6. The composition of the above-mentioned (5), wherein the natural cellulose is at least one member selected from the group consisting of pulp, cotton, hemp and kenaf.

Brief Summary Text (25):

16. The product of the above-mentioned (9), wherein the hydrophilic macromolecule is at least one member selected from the group consisting of natural cellulose, regenerated cellulose, bacterial cellulose, chemically-modified cellulose, silk, wool, polyacrylamide, polyvinyl alcohol, crosslinked polyvinyl alcohol, chitin, chitosan, ethylene-vinyl acetate copolymer and polyvinyl formal.

Brief Summary Text (26):

17. The product of the above-mentioned (16), wherein the natural cellulose is at least one member selected from the group consisting of pulp, cotton, hemp and kenaf.

Detailed Description Text (6):

The hydrophilic macromolecule of the inorganic porous crystals-hydrophilic macromolecule composite (A) to be used in the present invention is subject to no particular limitation as long as it swells with water. Examples thereof include natural cellulose such as pulp and kenaf, regenerated cellulose (e.g., cellophane, cellulose beads, rayon, cellulose sponge and the like), cotton, bacterial cellulose and cellulose derivatives obtained by chemically-modifying cellulose (e.g., ethyl cellulose, hydroxyethyl cellulose, hydroxypropyl cellulose, methyl cellulose, ethyl hydroxyethyl cellulose and carboxymethyl cellulose, and the like), and natural or artificial hydrophilic macromolecules such as silk wool, hemp, polyvinyl alcohol, crosslinked polyvinyl alcohol, chitin, chitosan, ethylene-vinyl acetate copolymer, polyvinyl formal and the like, highly water-absorbable macromolecule gels such as polyacrylamide and the like, collagen, propolis, urushi, wood powder and the like.

Detailed Description Text (22):

Examples of such carrier include resin, inorganic hardener and the like. Examples of said resin include natural resin, synthetic resin, blends thereof and the like. Specific examples of natural resin include pine resin, shellac, wax, collagen, propolis, urushi, wood powder and the like. Synthetic resin may be, for example, polyolefin (e.g., polyethylene, polypropylene and the like), polyamide (e.g., polyacrylamide and the like), polyvinyl alcohol, phenol resin and the like. In addition, butadiene rubber, silicone rubber and the like can be also used. Preferred is polyethylene in view of price, low boiling point and general applicability. The blend of a natural resin and a synthetic resin can be obtained by a method known in

the field of art. The mode of the carrier using a resin include, for example, a liquid (e.g., paint and the like), flexible one like rubber, board, sheet, string, net, cushion and the like.

Detailed Description Text (36):

A wood powder obtained from a mill factory and a polyvinyl alcohol glue are mixed, to which zeolite-pulp composite is added and kneaded. The mixture is placed in a mold frame and pressurized and dried for solidification.

Detailed Description Text (40):

b. Polyvinyl Alcohol Glue

Detailed Description Text (41):

Polyvinyl alcohol is dispersed in warm water at about 60.degree. C. and kneaded until it has appropriate viscosity (viscosity measured by a B type viscometer being about 10,000-100,000 centipoise), at which point a zeolite-cellulose bead composite is further added and kneaded.

Detailed Description Text (49):

Specific examples include at least one fiber selected from chemical fiber such as polyester fiber (e.g., polyethylene terephthalate), polyolefin fiber, polyurethane fiber, (poly)acrylic fiber, cellulose fiber (e.g., rayon, cupra and the like) and the like, natural fiber such as wool, silk, cotton, hemp, kenaf and the like, inorganic fiber such as glass fiber, carbon fiber, metal (e.g., copper, aluminum, iron, stainless and the like) fiber and the like, and active charcoal fiber. The above-mentioned chemical fiber may be made from a copolymer.

Detailed Description Text (65):

When a good touch is desired for a substrate, the use of silk, rayon, cotton, hemp or kenaf is preferable, and when high weatherability and water resistance are desired, the use of a sheet or film made from a polyolefin resin such as polyethylene, polypropylene, polystyrene, polyethylene terephthalate and the like, aramid resin, polyacrylate resin or fiber, or inorganic membrane made from titanium dioxide, glass and the like is preferable, when high heat insulating property is desired, wool, polyacrylonitrile fiber, aluminum foil, foamed polyurethane and foamed polystyrene is preferable, and when high electromagnetic resistance is desired, the use of a metal (e.g., iron, aluminum, copper and the like) fiber or metal foil is preferable.

Detailed Description Text (80):

The layer composed of an inorganic porous crystals-hydrophilic macromolecule composite (A) can take various shapes depending on the kind of the hydrophilic macromolecule to be used. For example, when the hydrophilic macromolecule is polyvinyl alcohol, crosslinked polyvinyl alcohol and the like, it can be a film. A preferable embodiment of the laminate of the present invention wherein the layer of the inorganic porous crystals-hydrophilic macromolecule composite (A) is a film which is shown in FIG. 3. In FIG. 3, 1' is a substrate film and 2' is a layer composed of an inorganic porous crystals-hydrophilic macromolecule composite (A), which is a film.

Detailed Description Text (86):

FIG. 5 shows an embodiment wherein a laminate of FIG. 3 is superimposed on the laminate of FIG. 1. The substrate 1 is preferably a nonwoven fabric made from a natural fiber. The layer composed of the inorganic porous crystals-hydrophilic macromolecule composite (A) is preferably a zeolite-pulp composite layer. The substrate 1' is preferably a plastic film, particularly polyvinyl alcohol copolymer film; the layer 2' made from an inorganic porous crystals-hydrophilic macromolecule composite is preferably a zeolite-cellophane composite layer.

Detailed Description Text (94):

When an inorganic porous crystals-hydrophilic macromolecule composite (A) wherein the hydrophilic macromolecule contains inorganic porous crystals in its inner matrix and a function improver (B) or function improving fiber (B1) are combined, or when a layer made from an inorganic porous crystals-hydrophilic macromolecule composite (A) wherein the hydrophilic polymer contains inorganic porous crystals in its inner

matrix is laminated on a function improving substrate (B2), the product, textile, nonwoven fabric, paper and laminate obtained from the composition of the present invention come to have high strength, in addition to the gas adsorption capability, volatile organic solvent removing capability, noncombustibility, heat insulating property, and heavy metal and radioactive element removing capability, that the inorganic porous crystals-hydrophilic macromolecule composite (A) has. It is also possible to improve a touch such as texture and the like, hydrophilicity, water repellency, anticorrosive property and the like according to the fraction improvers (B), (B1) and (B2) to be used. Therefore, the inventive laminate can be used for various applications such as underwear, bath mat, sheets, gloves, pillow cover, stuffing cotton for pillow, bedding, padded sleeveless coat, cushion and the like, shod paper, wall paper, clothes cover, cushion cover, bedding storage bag, insecticide sheet, pack for vacuum cleaner, filter for air conditioners, filter for air purifier, scrubbing brush for tableware, water draining garbage bag, carpet, hot carpet cover, curtain, deodorant sheet for refrigerator, special filter paper, freshness retention sheet for vegetable, meat and the like, packaging materials for freshness retention transport, wall materials, floor materials, ceiling materials, dewing absorption sheet and the like.

Detailed Description Text (106):

The zeolite-pulp composite (100 g) obtained in Production Example 2 was mixed with wood powder (300 g), polyvinyl alcohol, vinyl acetate adhesive (50 g) and water (200 g), and the mixture was placed in a mold and pressurized to give a product (thickness 3.0 cm).

CLAIMS:

6. The composition of claim 1, wherein the natural cellulose is at least one member selected from the group consisting of pulp, cotton, hemp and kenaf.
14. The composition of claim 7, wherein the natural cellulose is at least one member selected from the group consisting of pulp, cotton, hemp and kenaf.

May 3, 1994

DOCUMENT-IDENTIFIER: US 5308896 A

TITLE: Particle binders for high bulk fibers

Detailed Description Text (6):

A bleaching process, such as chlorine or ozone/oxygen bleaching may be used in pretreating the fibers. In addition, the fibers may be pretreated, as by slurring the fibers in baths containing antimicrobial solutions (such as solutions of antimicrobial particles as set forth below), fertilizers and pesticides, and/or fragrances and flavors, for release over time during the life of the fibers. Fibers pretreated with other chemicals, such as thermoplastic and thermoset resins may also be used. Combinations of pretreatments may also be employed with the resulting pretreated fibers then being subjected to the application of the binder coating as explained below.

Detailed Description Text (10):

Specific examples of natural fibers that contain a hydrogen bonding functionality include chopped silk fibers, wood pulp fibers, bagasse, hemp, jute, rice, wheat, bamboo, corn, sisal, cotton, flax, kenaf, peat moss, and mixtures thereof. Suitable synthetic fibers with hydrogen bonding functionalities include acrylic, polyester, carboxylated polyolefins, rayon and nylon. The hydrogen bonding functionality is an ester in acrylic fibers and a carboxylic acid in carboxylated polyolefin fibers, an ester in polyester, an amide in nylon, and a hydroxyl in rayon. Polyethylene and polypropylene would be unsuitable fibers for use in particle to fiber bonding in accordance with the present invention because they include only carbons and hydrogens without any oxygens or nitrogens that can participate in hydrogen bonds.

Detailed Description Text (19):

In one disclosed embodiment the added particles are superabsorbent particles, which comprise polymers that swell on exposure to water and form a hydrated gel (hydrogel) by absorbing large amounts of water. Superabsorbents are defined herein as materials that exhibit the ability to absorb large quantities of liquid, i.e. in excess of 10 to 15 parts of liquid per part thereof. These superabsorbent materials generally fall into three classes, namely starch graft copolymers, crosslinked carboxymethylcellulose derivatives and modified hydrophilic polyacrylates. Examples of such absorbent polymers are hydrolyzed starch-acrylonitrile graft copolymer, a neutralized starch-acrylic acid graft copolymer, a saponified acrylic acid ester-vinyl acetate copolymer, a hydrolyzed acrylonitrile copolymer or acrylamide copolymer, a modified cross-linked polyvinyl alcohol, a neutralized self-crosslinking polyacrylic acid, a crosslinked polyacrylate salt, carboxylated cellulose, and a neutralized crosslinked isobutylene-maleic anhydride copolymer.
